

A. Overall Correlation by Method

B. λ Variability by Method

C. Per-Band Breakdown by Method

METHODOLOGICAL ROBUSTNESS

D. Key Findings

All connectivity methods show
HIGH spectral universality:

- PLV: $r = 0.9974$ (best)
- Pearson: $r = 0.9902$ (primary)
- Coherence: $r = 0.8538$ (good)

All methods $r > 0.85$
All $\gg$ null expectation ($r = 0.002$)

Phase-based methods (PLV, Pearson)
show near-perfect universality,
suggesting spectral equilibrium
involves PHASE RELATIONSHIPS.

Coherence slightly lower but still
extraordinary, indicating some
frequency-specific variation.

Result is ROBUST to connectivity
measure choice.

Core finding holds across
methodologies.
