

A. Overall Correlation vs Band Number

B. Comparison Across Configurations

C. Hierarchical Pattern

Band Sensitivity Interpretation

- All configurations show $r > 0.93$
- All vastly exceed null ($r \approx 0.002$)
- Gradual decrease with more bands reflects:
 - Lower bands: Large-scale, slow dynamics (highly conserved across subjects)
 - Higher bands: Fine-scale, fast dynamics (more individual variability)
- Consistent with PMIR prediction: Strongest universality in dominant low-frequency modes
- Result is robust across band definitions
