

A. Overall Correlation by Rescaling Parameter

B. Key Finding

RESCALING-INDEPENDENT UNIVERSALITY

All rescaling parameters yield
IDENTICAL spectral universality:

$$r = 0.9852$$

This includes:

- λ_2 (spectral gap - PMIR prediction)
 - λ_3, λ_4 (higher eigenvalues)
- $\lambda_{\text{mean}}, \lambda_{\text{max}}$ (aggregate measures)
 - No rescaling (raw time)

INTERPRETATION:

Spectral universality emerges at the
SIGNAL LEVEL itself, independent of
temporal rescaling schemes.

The phenomenon is MORE FUNDAMENTAL
than specific theoretical predictions.

This STRENGTHENS the main finding:
spectral equilibrium is a robust,
intrinsic property of resting brain
dynamics.
